

ABSTRACT

A video phone system includes: a mobile communication terminal having a function for transmitting/receiving an imaged moving picture to/from a radio communication base station and performing communication; and a monitor device for displaying a moving picture transmitted/received to/from a radio communication base station by using a communication protocol between the radio communication base station and the mobile communication terminal. Thus, it is possible to perform high-image-quality videophone communication by using a camera arranged at a mobile communication terminal such as a mobile telephone, PHS, and PDA.
